Desktop Emulator

Using ACCU-DART from the computer workstation is easy with the Desktop Emulator!

The ACCU-DART Desktop module allows users to simulate the same functions as the radio-frequency scanners, directly from the desktop. This module was **designed to make training, testing and demonstrations easier**. Since the screen shows the exact same prompts and functions of the radio-frequency scanners, you do not need to purchase a scanner in order to see how ACCU-DART works. Many of our resellers have seen the Desktop Module in action during our web demos.

Your client does not need to purchase the desktop module for their system. However, being able to access the same functionality and prompts as the radio-frequency scanners can greatly assist the reseller in testing, training, implementation and support.

ACCU-DART's desktop capabilities can also be used in an operational environment where clients do not need radio-frequency access. **For example**, the desktop module can be used at a packing station to record what is being shipped as the boxes are being loaded. ACCU-DART will make sure that they are shipping the right goods to the right customers. You can even utilize a wedge-type reader to scan the barcodes directly into the desktop version. This is a very cost-effective solutions for your clients that don't need R/F.

The ACCU-DART Desktop Emulator is a great tool for resellers to provide better support for their clients.

ACCU-DART makes it easy to maintain inventory and bin accuracy within the warehouse. For more information about ACCU-DART, please visit www.accu-dart.com or contact info@accu-dart.com.
