DART - What Is It?

DART is a software solution that makes use of reliable and reasonably priced Radio-Frequency terminals. The system is available with most common required functions for efficient and effective inventory management. DART integrates seamlessly with Visual AccountMate.

Within a secure environment, DART allows users to perform daily activities without being bound to a wired Visual AccountMate device, achieving greater productivity. For example, users can pick and ship an order wirelessly from anywhere in the warehouse!

DART Features:

The DART solution is a complete inventory management system that enhances Visual AccountMate systems. All of the functions are executed from a wireless radio-frequency device and will automatically update Visual AccountMate data, saving you time and money!

Some of DART's Functions:

- | | |
|------------------------|---------------------|
| Item Inquiries | Inventory Transfers |
| Ship Sales Order | Put Aways |
| Receive Purchase Order | Picking |
| Physical Counts | Assign Lot Numbers |

Some of DART's Features:

- | | |
|-----------------------------|-------------------------|
| Source Code Available | Table-Driven |
| Integrated Bar Code Scanner | Easy to Customize |
| Add your own Functions | Voice Prompts Available |

The impressive functionality of DART makes our system a powerful tool to improve any business. Please contact us for a complete list of functions and features.

DART Benefits:

The primary benefits of DART can be narrowed down to CAT - Cost, Accuracy, and Timeliness.

DART is a comprehensive inventory management system and is available at a competitive price. Unlike other service providers, there are no additional servers or databases to purchase in order to use DART. The radio-frequency devices that control the DART system are cost effective and highly efficient. The benefits of DART include not only the costs of the equipment involved: there are intangible savings such as reduced labor involved in data entry and error checking that make this product an unsurpassable offer.

The R/F devices come equipped with bar code scanners that eliminate the need for manual data entry. You can rely on the accuracy of the DART system because data collected from the R/F device is automatically updated in your Visual AccountMate database, so there is no need to double-check orders before they are processed. Employees can now engage in more productive activities. Inventory and financial data are integrated seamlessly, meaning you can make more informed decisions. Customer satisfaction will improve because your business will deliver quality products on time, and without errors.

Real Time updates of Visual AccountMate production data sets DART apart from the competition. As your employees receive a shipment, the system performs the appropriate updates in your Visual AccountMate database that can be viewed by a PC. Best of all, the DART system is easy to learn and use. Your system will be up and running in no time. Employees will enjoy using the R/F devices and bar code scanners. They will get more work done with less effort and in less time.

DART will improve your business and save you money!

This Issue's Feature: Bin Transfers

Bin transfers allow you to move inventory from one bin in your warehouse to a different bin. DART ensures that your inventory and accounting systems are fully synchronized during this process and all other DART functions.

A user can simply log on to the RF device and a menu of available

functions will appear. Select Bin Transfers by entering the appropriate letter from the menu and press <Enter> on the RF terminal.

The system will then prompt the user to enter or scan in the item number. You can enter the item by item number, bar code, or by the customer's item number. If the item has specifications such as colour, or size, DART will ask for this information as well.

Next, the user must scan the number on the bin from which the item is to be moved. DART will check the database to confirm that the item already exists in this bin before continuing.

The user is then prompted to enter in the item quantity to be transferred. DART verifies that the selected bin has sufficient stock of this item to transfer. If your business makes use of serial numbers, and lot numbers, DART incorporates these concepts and will prompt the user to enter the appropriate information to track your items correctly.

Finally, the user can physically transfer the inventory to the new bin, and scan the destination bin number into the RF device.

Upon acceptance, the system performs the appropriate updates, just as if the transfer was done from a PC!

All of this can be done from a wireless RF device anywhere within the building!

We Want to Hear from You!

Suggestions for other functions you would like to see DART perform? Questions about any of DART's features? Looking for more information on the RF devices?
